

Key factors influencing customers to switch to another brand

Dr. Sarita Rana, Associate Professor, MSI

ABSTRACT

This research tries to understand, study and analyze the Key factors influencing customers to switch to another brand. The study also tries to understand the reasons behind this change, especially in the modern age when people change their preferences based on various key aspects of the brand, product, services, and many more.

We also wish to understand the mentality of consumers and how it affects their decision to utilize a particular product or service.

The study employs a multiple-dimensional view and includes the opinion/judgements of different people from various cultures, ethnicities and age groups (including teenagers and senior citizens)

KEYWORDS: Brand switching, Key factors, Consumer/customer, Consumer behavior, Customer satisfaction

OBJECTIVES

- How different factors lead customers to switch to other brands
- Which key factor is most likely to influence a customer to switch to another brand

INTRODUCTION

According to AMA, A brand is a name, term, design, symbol, or any other feature that identifies one seller's goods or services as distinct from those of other sellers.

Whereas according to Seth Godin, "A brand is the set of expectations, memories, stories, and relationships that, taken together, account for a consumer's decision to choose one product or service over another."

Consumer behavior is defined as "the process and activities people engage in when searching, selecting, purchasing, using, evaluating, and disposing of products and services so as to satisfy needs and desires", "including the decision processes that precede and follow these actions" .

Consumer behavior largely reveals how customers choose to invest their various resources, such as time, money, and ideas on various products in order to satisfy their needs and requirements.

Brand switching occurs when a company loses a formerly devoted customer to a competitor. In other words, a buyer alters his or her purchasing behavior by consciously opting to buy a different brand than their regular pick. When a consumer switches brands, they stop purchasing one brand of a product and begin purchasing a different brand.

The main purpose of this study is to investigate how factors like affordability, product quality, brand image, brand value, customer service, etc lead customers to switch to other brands. It also studies which key factor is most likely to influence a customer to switch to another brand.

Another major purpose of this study is to understand consumer behavior/psychology and how the various factors have a bearing on consumers to the decision to switch to another brand.

This thesis is divided into two sections: theoretical and empirical. The theory section begins with a definition of the concept of consumer behavior and then moves on to the characteristics of consumer behavior.

The decision-making process and the types of decisions are included in the study to gain a better understanding of the overall concept of consumer behavior.

The quantitative research method is used for the empirical portion. A questionnaire is used to collect data for this study. The study's findings and conclusions are presented at the end.

It seeks to comprehend the decision-making process and how it influences consumer purchasing behavior. (Solomon 2004, pp.6-8.)

Cultural, social, personal, and psychological factors all influence a consumer's purchasing behavior. Consumer behavior is a component of human behavior, and by studying previous purchasing behavior, marketers can forecast how consumers will behave in the future when making purchasing decisions. (Kotler&Armstrong 2010, p.160.)

This study aims to investigate how brand evangelism, which is an intensive form of brand support behavior, is influenced by consumers' relationships with brands. The study specifically looks into how brand identity and brand trust, two consumer-brand relational factors, affect brand evangelism. The three supportive behaviors of purchase intents, positive referrals, and oppositional brand referrals are operationalized in terms of brand evangelism, which is defined as a combination of adoption and advocacy behaviors.

More study on brand evangelist expectations and affiliations, tactics for building and strengthening connections with them, and methods for finally harnessing the advantages of this powerful consumer group would be extremely beneficial to businesses and brand managers.

RESEARCH METHODOLOGY

Data Source: Both primary and secondary

Primary: The study uses a questionnaire to take the primary source of data.

Secondary: The study uses different research papers as the secondary source of data.

Sample Size: 50 approx (New Delhi, Haryana, Uttar Pradesh)

Type of Sample: Convenient

Convenience sampling is a qualitative research sampling approach in which participants are chosen according to the researcher's convenience and availability. In this technique, participants are chosen because they are readily available to the researcher, as opposed to being chosen at random from a larger community.

LITERATURE REVIEW

Customer Satisfaction and Brand Switching

Customer satisfaction has the largest attention when it comes to customer retention and loyalty.

Customer satisfaction is subject to different interpretations. Customer Satisfaction is mainly a mental comparison between expectations and the perceived performance after a specific purchase (Qi, et al., 2012). A study conducted in Korea concluded that customer satisfaction can be considered

as an attitude and judgment, meaning that the customer will compare the encounter with the expectations and can have different encounters in different areas of the service leading to dissatisfaction (Lee, 2010). Therefore, customer satisfaction is considered a positive determinant of how strong is the relationship between the customer and the product provider. Several authors have linked customer satisfaction and customer loyalty together because of the very close relationship between the two variables and dealt with the two concepts as one in some studies (Santouridis and Trivellas, 2010). Actually, one of the models showed that satisfaction leads to loyalty (Santouridis and Trivellas, 2010). Therefore, satisfaction can be considered a more root factor in a considerable number of occasions. Furthermore, dissatisfied customers are more likely to search for what satisfies them in services provided by other competitors and can influence company's revenues more than satisfied customer (Andreson and Sullivan, 1993). In the same line, Chi, et al., 2008 Abdel Hamid Saleh, M., Althonayan, A., Alhabib, A., Alrasheedi, E. and Alqahtani, G., 2015. Customer Satisfaction and Brand Switching Intention:

A Study of Mobile Services in Saudi Arabia. *Expert Journal of Marketing*, 3(2), pp. 62-72

64 concluded that customer satisfaction is vitally important to the success and profitability for any company. It is considered a part of the company assets and heavily involved in determining the revenue and profits.

Customer satisfaction in the product sector can be measured by the performance of the product and more related to the tangible aspects. However, it is more complicated in the service sector and can be

considered a continuous process (Woo and Fock, 1999)

Min and Wan (2009) identified customer satisfaction as one of the major factors of switching brands. Based on the previous literature reviews, it is a common saying that customers compare their expectations with the actual product performance. If the customers are not satisfied. They will look for other alternatives, including switching to the competitive brands.. In different countries around the world, lacking customer satisfaction induce the customer to change the brand. Therefore, investigating the relationship between customer satisfaction and brand switching has aspecial concern.

Customer Service

Based on Woo and Fock, 1999 reviews, **Customer service** is ranked fourth among the factors that cause brand switching. However, that does not mean that customer service has to be given the least attention. Inversely, it could be seen as the pivot point in brand switching factors.

In other words, if the customer is satisfied and the quality of service is very high, the customers may never need to interact with the company's front office employees. Based on studies from various industries, the human factor is crucial when related to the customer service as the employee has a major impact on the customer experience (Omotayo and Joachim,2008).

Therefore, customer service can be seen as more of a transformation process managed by the front office employee and, and if not managed well, it might lead to dissatisfied customers and brand switching. The level of customer service does not only affect the customer base of the firm and define its profitability, but also can be a competitive advantage if customer service is superior (Carrick, 2010). having this competitive advantage is a substantial mean in acquiring and maintaining customers for a longer period of time. On the other hand, some authors have classified customer service among the highest factors affecting switching behaviour (Narayan and Jain, 2011).

Most of the authors have reached the consensus that customer service is heavily dependent on service employee actions in dealing with customer encounters. That means, basically, the customers will judge the firms' customer service through dealings with the employees and behavioural intentions can be formulated from this stage (Khan and Manthiri, 2012). It has to be made very clear that customer service is not only concerned with support and solving complaints, but it is also a root factor to cope with customers' requirements directlyor indirectly to attract them more to the firm and avoid unnecessary switching while it can be manageable (Al-Zoubi, 2013).Customer service was seen as a major factor in customer satisfaction which determine switching to another brand.

Value-added Services

Value-added services can extend to include the intangible objects like SMS, MMS etc.However, the variety of services, the level interface quality, the user's friendly applications, and the regular updates and upgrades are critical measures of the quality of the value added services. Furthermore, the way the firm manages

support the value-added services is very important in how these services are perceived by the customers (Wu and Frantz, 2012). A good example of this can be segmented or bundling the service even if one particular service serves the same concept. However, in today's business, it is possible to say that companies without proper value-added services can never survive if mainly relying on the core business. Some studies have emphasized that value-added services are almost as important as the core business and pricing, and rates of these services should be carefully managed, and customers should have a variety of options (Woo and Fock, 1999).

Some researchers may have not given too much concern to the value-added services (VAS), and some others may have not taken VAS at all into account when investigating the switching predictors. However according to Narayan and Jain, 2011, VAS has been found to be among the highest switching determinants and in some cases it was the second based on studies conducted in advanced countries like Korea. VAS has been found to be significant to almost all customers and companies with the appropriate VAS materials can attract more customers and retain others. A study made in Korea revealed that customers did not only focus on the reliability of the VAS but also the contents and its relevance to their preferences in general (Choi, et al., 2008). From these studies, it can be established that VAS is considered one of the key factors in customer satisfaction and switching. *Value-added service have a significant positive association with customer satisfaction and loyalty.*

Relationship between Trust and Brand Switching

Trust is the most important concept when discussing generation Y. Chen and Huang (2013) explained the definition of trust as believing that the information obtained is accurate, transparent and reliable. Soares, Pinho and Nobre (2012) were more focus on our related parties. The core belief is hope and confidence to others. Trust is always associated with a relationship involved, either with other parties or other things (Atkinson & Butcher, 2003; Greenwood & Van Buren III, 2010). In this study, trust is related to the brand. Lau and Lee (1999) explained that trust on a brand is focusing on the symbol instead of person. Trust is able to increase the loyalty of a person on a particular brand (Lau & Lee, 1999; Porral & Levy-Mangin, 2016; Yap, Ramayah & Shahadin, 2012). A person will not be easy to switch to other brands if they have believed in certain brands. *Trust has a negative and significant effect on brand switching.*

RESEARCH DESIGN

The research design used for this study is Descriptive.

A strategy used to describe a phenomenon's traits and behaviors is called descriptive research design. It uses instruments like surveys and case studies, direct observation, and no variable manipulation. Both longitudinal and cross-sectional data collection are possible. It is typical to conduct naturalistic observation in the subject's surroundings. Data are summarized by descriptive statistics like mean and median. Although it offers insightful information, there may be limitations

when extrapolating results to larger groups. In the research process, descriptive study frequently serves as an initial stage that lays the groundwork for more in-depth investigation.

RESEARCH TOOL

The study uses SPSS and advanced excel to analyze the data. Single-Factor ANOVA has been used to interpret results from collected data.

An analysis of variance, or Single-Factor ANOVA, is a statistical technique that evaluates the effect of two independent categorical factors on a dependent variable. In order to ascertain whether these factors have a significant impact on the dependent variable, it examines the primary effects of each element as well as any interactions between them. This technique, which is popular in the social sciences, biology, and psychology, is essential for experimental designs involving two categorical variables.

THEORY/ANALYSIS

AFFORDABILITY

An individual's buying decision is mainly influenced by his/her economic situation. The consumer's employment and purchasing power affect their choices and behavior while they shop. Consumer affordability and attitude towards money are influenced by income level. Individuals with similar occupations tend to have similar tastes in music, clothes, and recreational activities. They frequently interact socially and hold similar beliefs and values. Income level affects what consumers can afford and perspective towards money. (Solomon 2004, p. 12.) Those in lower income brackets typically have a stronger preference for purchasing necessities over luxury goods like high-end clothing. Khan and Nasr (2011) found a significant relationship between lifestyle and brand choosing (Lin & Shih, 2012).

PRODUCT QUALITY

Product quality is the collection of a product's features and qualities that contribute to the product's capacity to fulfill a user need. Pookulangara and Koesler (Pookulangara S, Koesler K. Journal of Retailing and Consumer Services. 2011;18(4):348-54.) defines it as a zero error rate that is, the ability to produce a perfect product on the first try. Producers have always struggled to produce high quality products in order to create good perception and experience among their consumers in order to compete with their competitors while maintaining good reputations among the existing customers, as the cost of retaining the existing customers can be less costly than the cost of acquiring new customers (Sabir RI, Irfan M, Sarwar MA, Sarwar B, Akhtar N, Journal of Asian Business Strategy. 2013;3(11):306-14).

VARIETY SEEKING

Variety seeking is defined as an individual tendency to find diversity in their choice of service or goods (Kahn, 1995). Variety seeking is divided into two types, which is derived and direct seeking variety behaviour (McAlister & Pessemier, 1982). Derived seeking variety behaviour is searching a variety of alternative options that are triggered by external environmental changes rather than internal motivation (Ha & Jang, 2013), while the direct seeking variety behaviour is explained as a direct motivation intrinsically and explained by the optimal stimulation level (OSL) theory (Jang & Feng, 2007; Menon & Kahn, 1995; Van Trijp et al., 1996). Van Trijp et al. (1996) explained that one of the causes of consumers doing variety seeking is due to boredom or saturation in a brand. There is an explanation that consumers are tired not on its brand but on product attributes (Inman, 2001). Therefore, a consumer seeks a variety of products to choose from.

CUSTOMER SERVICE & INTERACTION

In competitive marketplaces, service quality is a key component of corporate growth and competitiveness. Service quality is considered a positive driver for behavioral intentions of leaving, switching or remaining (Saunders and Petzer, 2010). Kothari, et al. (2011) sees service quality as “differentiation in services” which can be seen as a valid point because if all firms are having the same service quality, customers will not have an intention to switch to other service providers. That is why; customer service quality has a direct relationship in contributing to gain a substantial market share. Service quality is not just to attract new customers to the firm’s services, but also to retain and maintain existing customers and induce them for further repurchase intentions (Lee, 2010). Koivisto and Urbaczewski, 2004 says that service quality has a broader scope than usability and network performance; it includes various aspects of customer requirements and perceptions, and service providers’ offers and deliveries. It has been summarized by Chi, et al. (2008) that the most important characteristic of service quality is to fulfill customers’ needs and wants.

CUSTOMER SATISFACTION

Customer satisfaction may be thought of as the assessments made by consumers based on all of their purchasing experiences, excluding any particular purchases they may have done in the past. It may be used to describe how a consumer really utilized a product, regardless of whether their expectations were fulfilled or surpassed. The more the satisfaction, the more it surpasses the customer's expectations. In the context of consumer switching behavior, customer satisfaction is the factor that leads to long term customer retention because unsatisfied customers have a very high switching rate (Schiffman LG, Kanuk LL. 8th Ed. NY: Prentice-Hall Inc.; 2004). If the product satisfies the client's wants and demands, the consumer will be satisfied and likely become a loyal customer.

BRAND IDENTIFICATION

Identification with an entity is likely to occur when that entity satisfies one or more of their self-definitional needs such as self-categorization, self-distinctiveness, and self-enhancement (Ashforth and Mael, 1989; Scott and Lane, 2000). Empirical research has demonstrated that the psychological attachment that is signified by identification with an entity leads to several positive outcomes in favor of that entity, including greater cooperation (Ashforth and Mael, 1989), loyalty (Bhattacharya and Sen, 2003), negative out-group and positive in-group evaluations (Hogg and Abrams, 1988), word of mouth (Kim et al., 2001), and organizational citizenship behaviors (Morrison, 1996). Specifically, consumer-brand identification refers to consumers' "psychological state of perceiving, feeling, or valuing his or her belongingness with a brand" (Lam et al., 2010, p. 129). Purchase and consumption of brands enable consumers to construct their identities. When consumers perceive that brands possess characteristics that they consider as central to their own identities, they incorporate the brand's characteristics into their self-identity and self-definition, and communicate such self-definition to others (Underwood et al., 2001).

BRAND TRUST

The readiness to rely on someone based on ideas about their traits and actions in the face of risk is known as trust. Brand trust is the willingness to rely on a brand, based on beliefs about that brand, despite the risk or uncertainty associated with that brand. Brand trust is composed of cognitive beliefs (Delgado-Ballester et al., 2003) as well as affective perceptions about the brand (Elliott and Yannopoulou, 2007). Beyond expectations for the qualities or performance of the goods, brand trust also includes emotional assessments. The emotional elements that can lead to brand trust include expectations of brand integrity, honesty, and/or benevolence, which encompass expectations that the brand will act with the consumers' best interest in mind across all products sold under that brand. Consumer attitudes and brand-related actions are influenced by brand trust, including purchases, behavioral and attitude loyalty, perceptions of brand value, brand commitment, and brand referrals.

BRAND EVANGELISM / REFERENCE GROUPS

It is also well accepted that consumer-brand relationships propagate consumer-to-consumer communication and other brand-related behaviors (McAlexander et al., 2002; Muniz and O'Guinn, 2001; Pimentel and Reynolds, 2004). Organizations have always been interested in understanding consumers' relationships with their brands in order to cultivate and encourage behaviors that benefit the brand (McAlexander et al., 2002; Keller, 2012). In today's highly connected marketplace, contemporary organizations are also paying careful attention to a relatively smaller, but highly influential, group of consumers called brand evangelists who embrace their brands intensely, actively disseminate brand-related experiences to others, attempt to recruit others to experience the brand, and dissuade others from consuming rival brands (McConnell and Huba, 2003). Brand evangelists are likely to demonstrate approach-avoidance relationships (Park et al., 2013; Schmitt, 2013), albeit for different brands within the

same product category. People come to know about a certain brand through relatives, peers, and friends and make a decision to switch to another brand based on their suggestions.

3	SUMMARY						
4	<i>Groups</i>	<i>Count</i>	<i>Sum</i>	<i>Average</i>	<i>Variance</i>

Our Research Paper through the use of Advanced Excel and Anova comes to the Analysis that Consumers rely on a number of factors while choosing a Brand.

This Analysis of 47 Respondents from 3 age categories has helped us to first identify the various factors that affect the Brand Selection for a consumer. Apart from this, the analysis also identifies the effect of each of these factors on people.

Each of these factors have a different magnitude for each of the respondents on which they make decisions. Using Anova we are able to curate the count, sum, average and variance.

LITERATURE REVIEW

Czinkota et al., (2001) explain that the core of the modern marketing practice is to understand and respond to consumers' values and needs. Maintaining a long-term relationship with a customer is one of the fundamental factors determining the value that the customer provides to the company. A serious threat to achieving a long-term relationship is the customer's switching behavior (Alnaimi et al., 2011).

According to Ahmed et al., (2015), consumer switching behavior is being considered as a complex study of factors, which stimulate the behavior of consumers towards switching their purchase between brands. When consumers choose to replace their present brands with alternative ones, this is known as brand switching. This could be a reaction to consumer unhappiness with their current brand, the allure of recently launched brands, or their need for diversity. In the latter case, brand

switching could be encouraged by rival companies' promotional campaigns. The influencing factors listed below can be used to better understand the cause-and-effect relationship between various variables and how changing those variables can affect customer behavior.

Various studies have discussed and investigated potential antecedents of customers' brand switching. Assael (2002)

Basically, the meaning of brand switching is to move loyalty from one brand to another by the customer. Brand switching indicates that the original brand is no longer attractive (Al-Kwafi & Ahmed, 2015).

Anderson and Sullivan (1993) explain when consumer switches to another brand, it because the strategy developed is not able to maintain or motivate existing consumers

IMPLICATIONS OF THE RESEARCH

This research has various implications. It explores the practical application of various key factors affecting a consumer's decision which affects his/her buying behavior. The study can suggest future research directions and industrial impacts. Additionally, it may raise business awareness. This study would also help companies and businesses to understand the market better.
